

OPERATION STOLEN LEGACY — SQL CHEAT SHEET

A Beginner's Quick Reference Guide for Investigating Databases & Solving Digital Mysteries

1. THE 4 BASIC SQL BUILDING BLOCKS

Command	What It Does
SELECT	Tells the database which columns of data to display.
FROM	Tells the database which table to look inside.
WHERE	Filters rows based on conditions (e.g. location, time).
JOIN	Links two tables together using a matching ID column.

2. DATABASE SCHEMA MAP

people (Attendee Roster)

person_id | first_name | last_name | role |
department | registered_hall | access_level

activity_logs (CCTV & Badges)

log_id | person_id | timestamp | location |
activity | details

communications (Emails & Statements)

record_id | person_id | type | timestamp |
content | evidence_level

3. USEFUL FILTER OPERATORS

=	Exact match: WHERE role = 'Security'
LIKE	Partial text search: WHERE details LIKE '%case%'
AND / OR	Combine conditions: WHERE level = 'High' AND type = 'Email'
ORDER BY	Sort results: ORDER BY timestamp ASC

Detective's Golden Rules

- Always end your SQL statements with a semicolon (;).
- Wrap text and time values in single quotes (e.g., 'Hall A').
- Column names & keywords are not case-sensitive, but text values are!

4. STEP-BY-STEP DETECTIVE QUERIES

Step 1: View Everyone Registered at the Event

Retrieves all names, roles, and departments from the people table.

```
SELECT person_id, first_name, last_name, role,  
department  
FROM people;
```

Step 2: Find Movements Near the Trophy

Filters activity logs for anyone seen at the display before 4:00 PM.

```
SELECT person_id, timestamp, activity, details  
FROM activity_logs  
WHERE location = 'Trophy Display';
```

Step 3: Connect Names with Timeline (JOIN)

Joins people & logs tables so you see names instead of just IDs.

```
SELECT p.first_name, p.last_name, a.timestamp,  
a.activity  
FROM people p  
JOIN activity_logs a ON p.person_id = a.person_id  
WHERE a.location = 'Trophy Display';
```

Step 4: Check High-Priority Forensic Clues

Extracts fingerprints and high-level communications evidence.

```
SELECT p.first_name, c.type, c.content,  
c.evidence_level  
FROM communications c  
JOIN people p ON c.person_id = p.person_id  
WHERE c.evidence_level = 'High';
```

Step 5: Catch Alibi Contradictions

Compare a suspect's statement against their logged movements.

```
-- Check suspect's official statement  
SELECT content FROM communications WHERE person_id = 4;  
  
-- Compare with real badge & CCTV logs  
SELECT timestamp, location, activity FROM  
activity_logs WHERE person_id = 4;
```
